# PhD Journey

Challenges & Trials

# Challenges faced

## **Institutional Challenges**

Institutional goals and Academic credentials are misaligned due to lack of PhD staff and motivated students

## **Challenges on the ground**

Mismatch of students' learning perspective and supervisor's teaching perspective caused by lack of critical thinking, tacit knowledge and different learning culture

## **Scholastic Challenges**

Western vs Eastern knowledge creation approach

# Institutional Challenges

## Institutional Goals

Increase high impact  
publications  
+  
Increase research grants  
+  
Patented IPs

## Academic Credentials

Post Graduate students to  
graduate on time  
+  
Quantity production

## Resources

PhD staff  
+  
Motivated students

# Challenges on the Ground

## Students' Perspective

Students unsure if their research is original  
+  
Hard to understand LR  
+  
Problems finalizing their Research Question  
+  
Hard to graduate on time

## Supervisor's Perspective

Students lack PhD technical skills  
+  
1-2 years development period to reach scholarship

## Causes

Lack of critical thinking skills  
+  
Different learning culture  
+  
Tacit knowledge realm

# Scholastic Challenges

**Western vs Eastern  
Knowledge Creation Approach**

**Theory-centric Vs. Method-centric  
for Non-native English Speakers**

***Theory.** A statement of rule regarding a phenomenon obtained through systematic and verifiable steps (Ibrahim, 2011)*

# Knowledge Ideation Process

## Step 1 – Identify Problem or Issue

- Problem is always generic, i.e. achieving SDG targets
- Career plan since long lasting

### LEADING STATEMENT:

Prototyping models are thrown away after they are used thus causing lots of solid waste in product design.

### PROBLEM STATEMENT [ Need + Purpose ]:

There is a need for alternative biodegradable material for 3D printing technique in order to provide affordable material to industry market.

# Knowledge Ideation Process

## Step 2 – Set Inquiry Complexity

Unlimited opportunities to set  
your journey following your  
heart's desire

No	Construct Definition	RQ Construct
1	“element” used in or impacted by study	<b>WHO</b>
2	“body of K” required to solve the problem	<b>WHAT</b>
3	“action”/“impact” on the “element”/“body of K” in the study	<b>HOW</b>

# Knowledge Ideation Process

## Step 2 – Set Inquiry Complexity

- Use this table to decide complexity of study
- Plan the content of your study
- Can update content by revising earlier inputs

Level	WHO	WHAT	HOW	RQ OPTIONS
MASTER	1	1	1	9
PHD (OPTION 1)	1	1	2	16
PHD (OPTION 2)	1	2	1	16

Universal Design principles for improving quality of life for active ageing in Malaysia through accessibility in the built environment	
by	
Ahin Ahim	
<b><u>ABSTRACT</u></b>	
<b><u>PROBLEM</u></b>	
There is a need for the adoption of Universal Design (UD) principles in the built environment in order to support active aging in Malaysia.	
<b><u>RESEARCH METHOD</u></b>	
The purpose of this study is Universal Design principles for improving quality of life for active ageing in Malaysia through accessibility in the built environment. This study uses Literature Review to/for To analyse key facilities, services and destinations constituting accessibility in the built environment. Then it uses literature review to/for To evaluate Universal Design principles that can be applied for making accessibility in the built environment, To evaluate the Universal Design principles that could be applied for making accessible built environment. Later it uses Survey to/for To establish Universal Design principles for improving quality of life for active ageing in Malaysia through accessibility in the built environment?.	
<b><u>EXPECTED RESULTS</u></b>	
Results of the study would include key facilities, services and destinations critical for accessibility; policies regarding accessibility requirements; policies regarding accessibility requirements, Types of accessibility features in the built environment, UD principles, Methods of UD application, Methods of UD application, Access audit method and scoring . The results are expected to lead towards development of Ageing Framework for UD application in the built Environment.	
<b><u>OUTLINE OF RESEARCH PAPER/PROPOSAL.</u></b>	
After the introduction of the background problem, this paper will present the literature on accessibility in the built environment, Universal Design principles, and improve quality of life for active ageing in Malaysia. Then, it describes the research methodology before presenting the expected results.	
<b><u>EXPECTED CONTRIBUTIONS / BENEFITS OF STUDY</u></b>	
The study contributes in the development of an Ageing Framework for UD application in the built Environment and recommends appropriate UD features in the built environment to support active aging in Malaysia.

## Step 6 – Building Review Library

### Critical Review Coverage:

What is the article about?

What is the author's POD (Point of Departure)?

How does the article support your study? → STRENGTH

How does it not support your study? → WEAKNESS

What else is needed to support your study? → Researcher's POD

# Knowledge Ideation Process

## Step 6 – Building Review Library

### An Article Review

- Library of reviewed articles
- Progressive built up
- Store for future use

El-Shekeil et al (2014) highlights the influence of fiber content on the mechanical (i.e. tensile, flexural, impact, hardness and abrasion resistance) and thermal (i.e. TGA) properties of kenaf fiber reinforced thermoplastic polyurethane composites. El-Shekeil et al (2014) found 30% fiber loading exhibited the best tensile strength, while modulus increased with increase of fiber content, and strain deteriorated with increase of fiber content. Flexural strength and modulus increased with increase of fiber loading where increase of fiber loading resulted in decline in impact strength. However, El-Shekeil et al (2014) limits the use of the Kenaf bast fibre thermoplastic polyurethane (TPU) composite to larger products' manufacturing. Therefore, based on El-Shekeil et al (2014) my study intends to analyse whether the mechanical (i.e. tensile, flexural, impact, hardness and abrasion resistance) and thermal (i.e. TGA) properties of kenaf fiber reinforced thermoplastic polyurethane composites could be use for 3D RP materials.

Naseemah Yusoff | 04.01.2016

methodology (Remote Sensing, GIS and Spatial Web Technology) to model urban space walkability, which enables local residents to make informed decisions that will improve their living conditions and physical health related to the micro-scale built environment characteristics and the neighbourhood environmental quality (Adkins et al. 2012; Lwin & Murayama 2011).

However, most of the existing studies on natural and built environment physical walking features are limited to the normative objective measure of built environment attributes (Kelly et al. 2011; Southworth 2005; Adkins et al. 2012; Millward et al. 2013) and partial for elderly. Less consideration are given towards the subjective measures (e.g. routes to popular destinations, unfriendly neighbours or past negative experiences) including equity aims of walking (Adkins et al. 2012; Utman 2003). Existing walkability studies also limited to transportation, urban planning and health benefits (Lee & Lee 2014; Southworth 2005; Pooley et al. 2013), rather than social and economic benefits of walking (Utman 2003) especially towards elderly's walking behaviour for urban short trip walking. Study on walking travel patterns and street liveability (Millward et al. 2013; Mahmoudi et al. 2015) give less focuses on the influencing factors of walkable public realm such as demographic and behavioural factors. Although the analysis of route paths has been widely used in GIS applications (2011), the integration of green factors and subjective measures with the analysis of the route path is still lacking in the GIS arena.

In general, there exists built environment attributes for supporting walking behaviour and experience. They also could be measured objectively and subjectively. Among them, include integrating green factors (streetscape and parks), quality of path, network connectivity, adequate services and maintenance and analysis of the route path in the GIS application. Therefore my study will expand deeper the existing walkable network attribute, is it compatible for elderly's user. My study recommending the authority to provide walking to reduce health cost for the city and extend walking to improve social and economic equity. My study also proposing to increase walking opportunities and walking's mode share through recognizing the importance of non-home trips, and encourage opportunities for pedestrian through investigating pedestrian activities that need to be supported by the natural and built environment physical walking features. It is recommended to use a mixed-method study with a qualitative follow-up component to determine the nature of the reported relationships between objective and subjective measures of natural and built environment physical walking features.

2

Naseemah Yusoff | 04.01.2016

## 2.2.2 Urban Design Qualities

### Accessibility

Accessibility is one of the most important urban design qualities that could support city's ability to encourages exercise, healthy living, and ageing in place (Weiss et al. 2010). A systematic patterns of uneven access to parks help to explain inequalities in health outcomes across socio-demographic New York City populations (Miyake et al. 2010). Intensity of social interaction within the neighbourhood parks is as a result of the combination of the legibility attributes and density within a residential areas (2014). Walkability studies widely used Walk Score calculation to objectively measure foot accessibility in a place (Lwin & Murayama 2011). Inequities of park may lead to the misunderstanding between the built environment and physical activity (Miyake et al. 2010). Accessibility and distribution of urban space (Miyake et al. 2010) could provide an intensity space of social interaction and help to solve problems (Miyake et al. 2010; Millward et al. 2014). However, existing study on accessibility limited to transportation, urban planning and health benefits (Moulay et al. 2014) and evaluating accessibility based on built environment and physical activity (Weiss et al. 2010). The evidence evaluating the relationships between the built environment and physical activity among elderly in order to provide solutions for inactivity issues.

### Mixed-Land Use

Mixed-land use urban qualities that includes commercial, residential, and recreational land use in a neighbourhood are positively affect social interaction, health and well-being (Talen & Koschinsky 2014). Density and legibility of a city could improve social interaction (Moulay et al. 2014) and values of surrounding property (Carter et al. 2010). While an unplanned city has been experiencing problems of congestion, pollution, and social and physical infrastructure (Bhattacharyya & Mitra 2013). Physical factors are one of the elements that are affecting behaviour and outcome of the CWD neighbourhood (Talen & Koschinsky 2014). Pedestrian infrastructure and land use mix significantly contributed to increases in walking mode share (Talen & Koschinsky 2014).

Existing study on rapid motorization provide support that the increasing level of economic status of the city dwellers has put immense pressure on transportation system of the town resulting in high level of congestion and fatalities (Bhattacharyya & Mitra 2013). Physical factors are one of the elements that are affecting behaviour and outcome of the CWD neighbourhood (Talen & Koschinsky 2014). Pedestrian infrastructure and land use mix significantly contributed to increases in walking mode share (Talen & Koschinsky 2014).

3

Naseemah Yusoff | 04.01.2016

rental multi-family residential property values, where higher development density with higher street and sidewalk coverage were also favoured by retail service uses (2012).

However, Sohn et al. study have not research on the factors making high-density neighbourhoods an attractive living environment would help develop urban design strategies for creating walking-friendly urban settings that are marketable (Sohn et al. 2012). An existing study on mixed-land use study lack of professionals views from variety of fields including transport planning, transport engineering, health, tourism, social inclusion, crime prevention, urban design in preparing walking plan (Bhattacharyya & Mitra 2013). Studies of Sundquist et al. (2011) and Weiss et al. (2010) study did not cover the objective and the subjective measures of mixed-land use impact towards elderly physical activity and travel pattern (Millward et al. 2013) which reflect elderly self-selection and walking mode share in the CWD neighbourhood (Talen & Koschinsky 2014).

In general, there exist a need for the professionals to develop urban design strategies to support walking behaviour, particularly elderly in spatial just walking-friendly urban setting. My study will integrate both, objective and subjective measures and the physical activity in the built environment to evaluate the density of social interaction within a city among elderly. The empirical evidence evaluating the relationships between the built environment and physical activity could provide a better understanding of self-selection and causality issues among elderly in a city. My study will investigate walking opportunities and walking's mode share through recognize the importance of non-home trips, and encourage opportunities for pedestrian.

Accessibility is one of the most important urban design qualities that support walking behaviour. It has to do with perceptions of the surrounding areas, such as appeal and legibility (Weiss et al. 2010), and will be affected by the cumulative impact of multiple interactions and land use patterns (Moulay et al. 2014). Both positive and negative impact (Kelly et al. 2011). Weiss et al. (2010) study provide evidence that both actual environmental features and perceptions of these attributes influence walking behaviour. The important pedestrian attributes including pavement cleanliness, safe crossing places, good connectivity and sense of security Kelly et al. (2011). However, existing study is limited to the objective measures of walkability that refers to the built environment attributes (Kelly et al. 2011) and perception of safety and security in a neighbourhood area (Weiss et al. 2010). In general, there exist a need to propose the objective and subjective measures of walking experience considering the perception of security in a city context among elderly.
